Machine learning (ML)

Machine Learning is the most popular technique
of **predicting** the **future** or **classifying information** to help people in making necessary decisions.

Machine Learning algorithms are trained over instances or examples through which they learn from **past experiences** and also **analyze** the **historical data**.

Therefore, as it trains over the examples, again and again, it is able to identify patterns in order to make predictions about the future.

Here are the steps to get started with machine learning:

Define the Problem: Identify the problem you want to solve and determine if machine learning can be used to solve it.

Collect Data: Gather and clean the data that you will use to train your model. The quality of your model will depend on the quality of your data.

Explore the Data: Use data visualization and statistical methods to understand the structure and relationships within your data.

Pre-process the Data: Prepare the data for modeling by normalizing, transforming, and cleaning it as necessary.

Split the Data: Divide the data into training and test datasets to validate your model.

Choose a Model: Select a machine learning model that is appropriate for your problem and the data you have collected.

Train the Model: Use the training data to train the model, adjusting its parameters to fit the data as accurately as possible.

Evaluate the Model: Use the test data to evaluate the performance of the model and determine its accuracy.

Fine-tune the Model: Based on the results of the evaluation, fine-tune the model by adjusting its parameters and repeating the training process until the desired level of accuracy is achieved.

Deploy the Model: Integrate the model into your application or system, making it available for use by others.

Monitor the Model: Continuously monitor the performance of the model to ensure that it continues to provide accurate results over time.

Application of M/C Learning

Use Cases

What Is Machine Learning?

Machine learning is a subset of artificial intelligence (AI) which provides machines the ability to learn automatically & improve from experience without being explicitly programmed.

Real Life Example of Supervised machine learning

Email Filtering

Image Classification

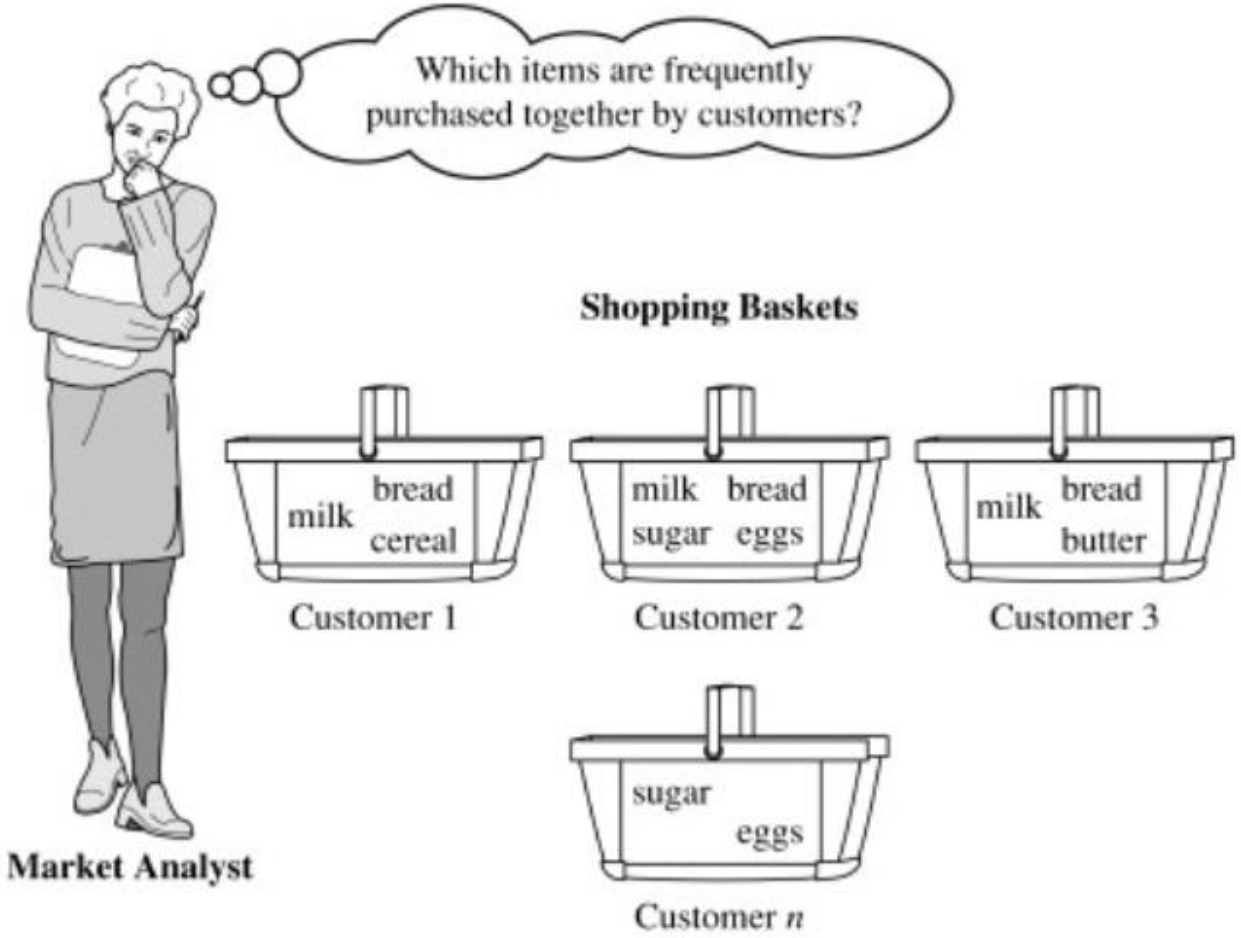
Fraud Detection

Visual Recognition

Different recommendations system :

Amazon, Facebook, Google, Netflix, Youtube, Contains supervised learning techniques.

Real Life Example of Unsupervised machine learning



Finding out which customers made similar product purchases from the market

Real Life Example of Reinforcement machine learning

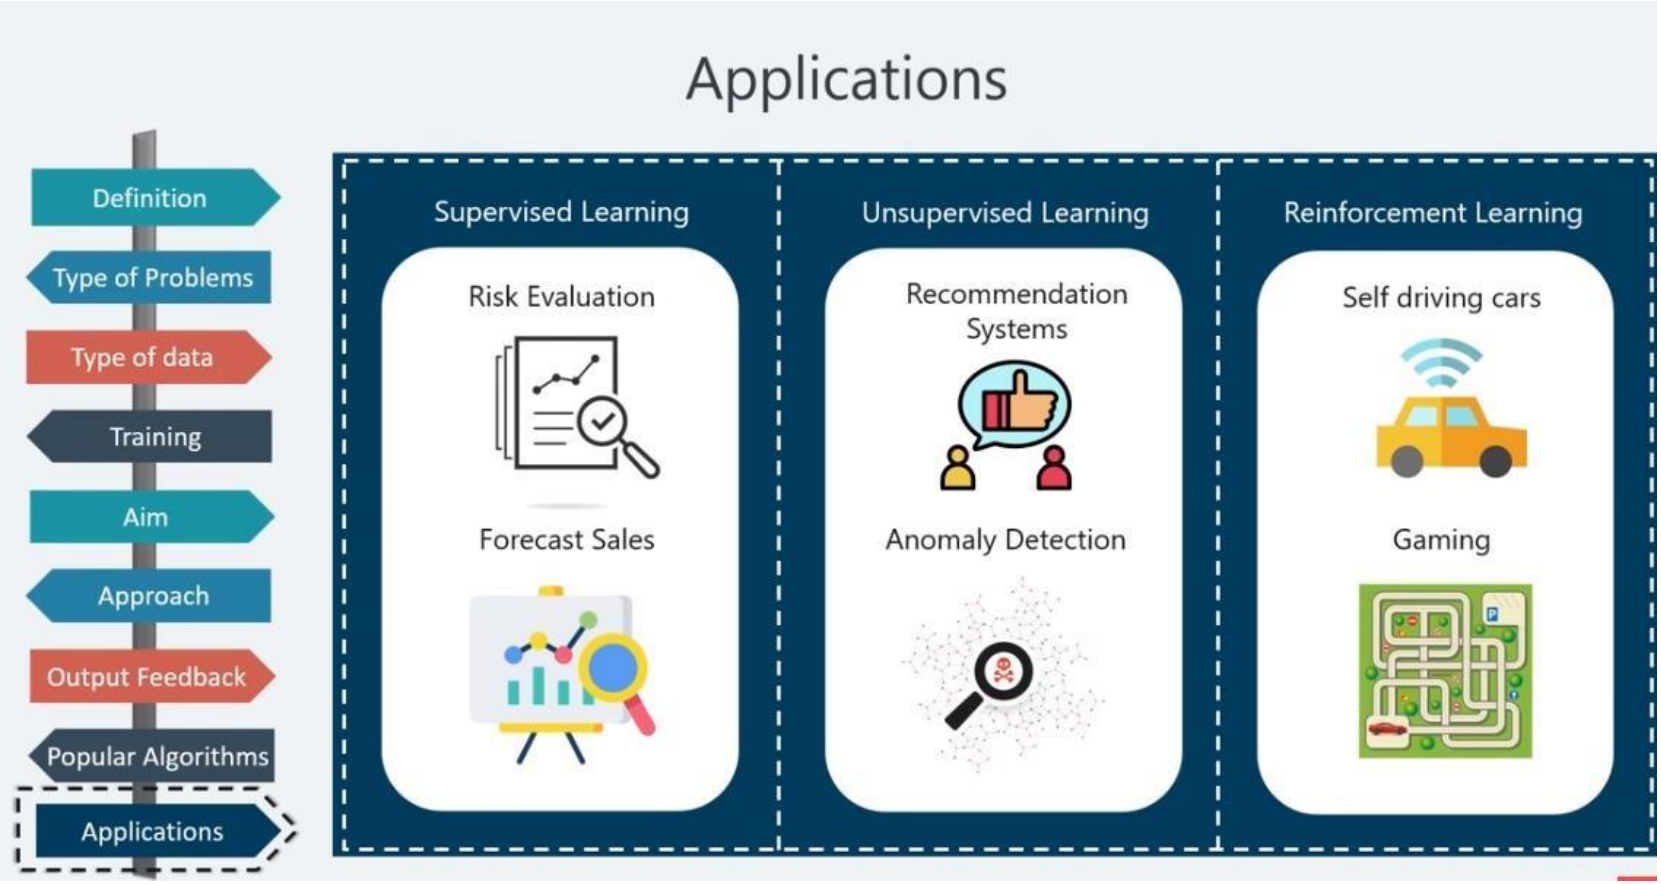
Robots equipped with visual sensors from to learn their surrounding environment

Traffic analysis and real-time road processing by video segmentation and frame-by-frame image processing

CCTV cameras for traffic and crowd analytics

Scanners to understand and interpret text

Applications



Use Cases

Use Case 2

Problem Statement: To establish a mathematical equation for **distance** as a function of **speed**, so you can use it to predict **distance** when only the **speed** of the car is known.

```
> cars
   speed dist
1      4    2
2      4   10
3      7    4
4      7   22
5      8   16
6      9   10
7     10   18
8     10   26
9     10   34
10    11   17
11    11   28
12    12   14
13    12   20
14    12   24
15    12   28
```

Use Cases

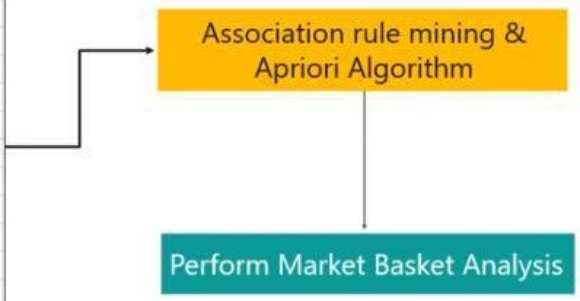
Use Case 4

Problem Statement: To perform Market Basket Analysis by finding association between items bought at the grocery store

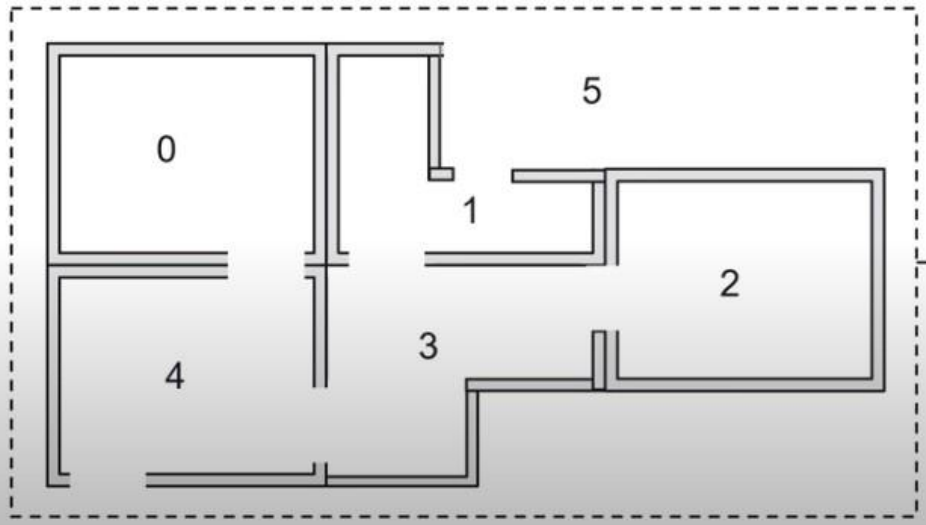
	A	B	C	D	E	F	G	H
1	citrus fruit	semi-finisl	margarine	ready soups				
2	tropical fr	yogurt	coffee					
3	whole milk							
4	pip fruit	yogurt	cream che	meat spreads				
5	other vege	whole mil	condensec	long life bakery product				
6	whole mil	butter	yogurt	rice	abrasive cleaner			
7	rolls/buns							
8	other vege	UHT-milk	rolls/buns	bottled be	liquor (appetizer)			
9	pot plants							
10	whole mil	cereals						
11	tropical fr	other vege	white brea	bottled wa	chocolate			
12	citrus fruit	tropical fr	whole mil	butter	curd	yogurt	flour	bottled wa
13	beef							
14	frankfurte	rolls/buns	soda					
15	chicken	tropical fruit						

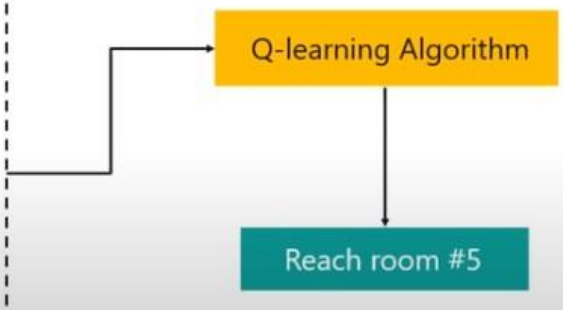


Use Cases

Use Case 5

Problem Statement: Place an agent in any one of the rooms (0,1,2,3,4) and the goal is to reach outside the building (room 5)





Terms……

…

Labels

Label is a value or thing we are trying to predict.

The label could be future price of a product, it can be whether the email needs to be routed to SPAM or INBOX

If we take example of following equation :

$$Y = Mx + C$$

So Y is the label in this case.

Terms……

…

Features

A feature is an input variable - the x variable in simple linear regression

$$Y = Mx + C$$

A simple machine learning project might have just one feature.

while a more complex machine learning project could use hundreds of features like:

x1,x2,...x100

In the modeling and prediction of what would be the future price of product, the features could include the following:

- Pack size of the product
- Month of the year
- Competitors price of similar product

Terminologies……

Examples

An "**example**" is a particular instance of data.

Examples are of two categories:

- Labeled

  This includes both features and Label

- Unlabeled

  This includes only features

Terminologies……

…

Labelled Examples

Here first 3 columns are features and 4th column is the label

Labelled examples are use to train and test the models to be used for predictions.

month of the year	pack size	competitor price	Products retail price
1	small	10	9.5
2	small	11	10.5
3	small	10.5	10
4	small	9.5	9

Terminologies……

…

Unlabelled Examples

It contains only features and no label

The model trained using labelled examples is then used to predict the labels on unlabelled examples

month of the year	pack size	competitor price	
1	small	10	
2	small	11	
3	small	10.5	
4	small	9.5	

Terminologies……

Model

It defines the relationship between features and label.

This relationship is derived by trying to fit various readily available algorithms or writing an custom algorithm.

Two key terms related to models are :

- Training – This is the process where we feed the labelled data to the model and make it learn the relationship between features and label
- Prediction – This is the process we feed unlabelled data to the trained model and obtain the values of labels

Terminologies……

…

Regression vs Classification

A regression model predicts continuous values.

For example, regression models make predictions that answer questions like the following

- What is the value of a house in California?
- What is the probability that a user will click on this ad?

A classification model predicts discrete values.

For example, classification models make predictions that answer questions like the following:

- Is a given email message spam or not spam?
- Is this an image of a dog, a cat, or a hamster?

Terminologies……

…

- Analytics : Descriptive, Predictive , Prescriptive.
- Visualization : Data in to Graphs

Terminologies……

…

- DataSet
- DataFrame
- Data
- RawData

Storage of data

Terminologies……

…

- Outliers
- Missing Values/Imputation
- Feature Selection/Dimensionality Reduction
- Imbalance Data: Oversampling and Undersampling
- Time Series Data
- Feature Engineering

Terminologies……

Outliers = ODDS

Detecting Outliers:

BoxPlot

Quartliles

Scatter Plot

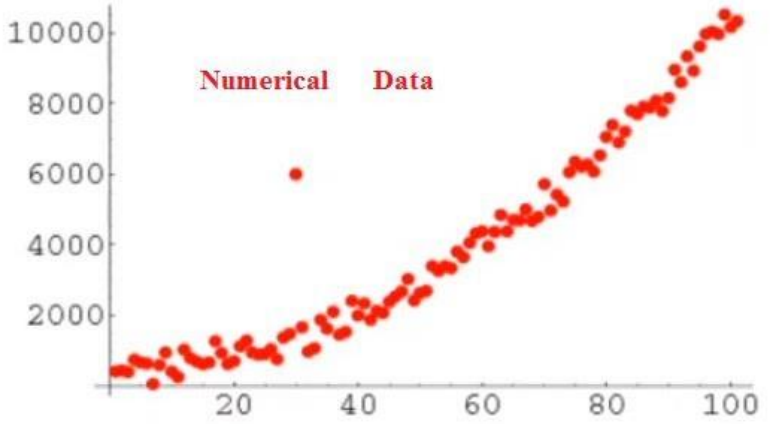
Z-score

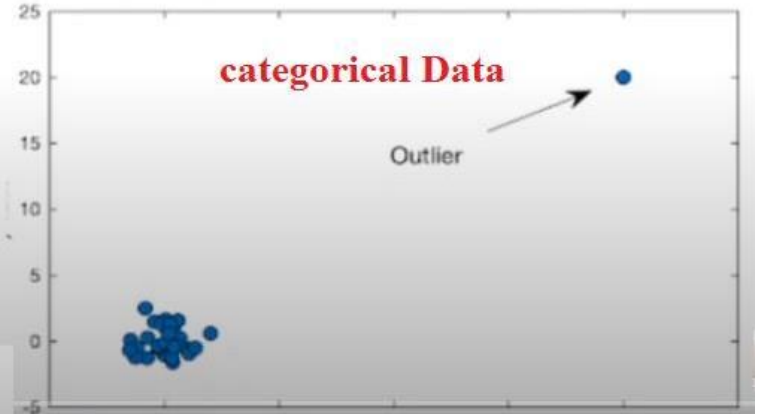
Treating Outliers

Capping

Deletion

Replacing by mean,median and mode





Terminologies……

…

Input and Output

- Input Variables | Features | Columns | Dimensions | Characteristics | Independent Variables | X | Multiple

- Output variables | Outcome | Result | Target | Y | Dependent Variables | Y Predicted | | Single

Terminologies……

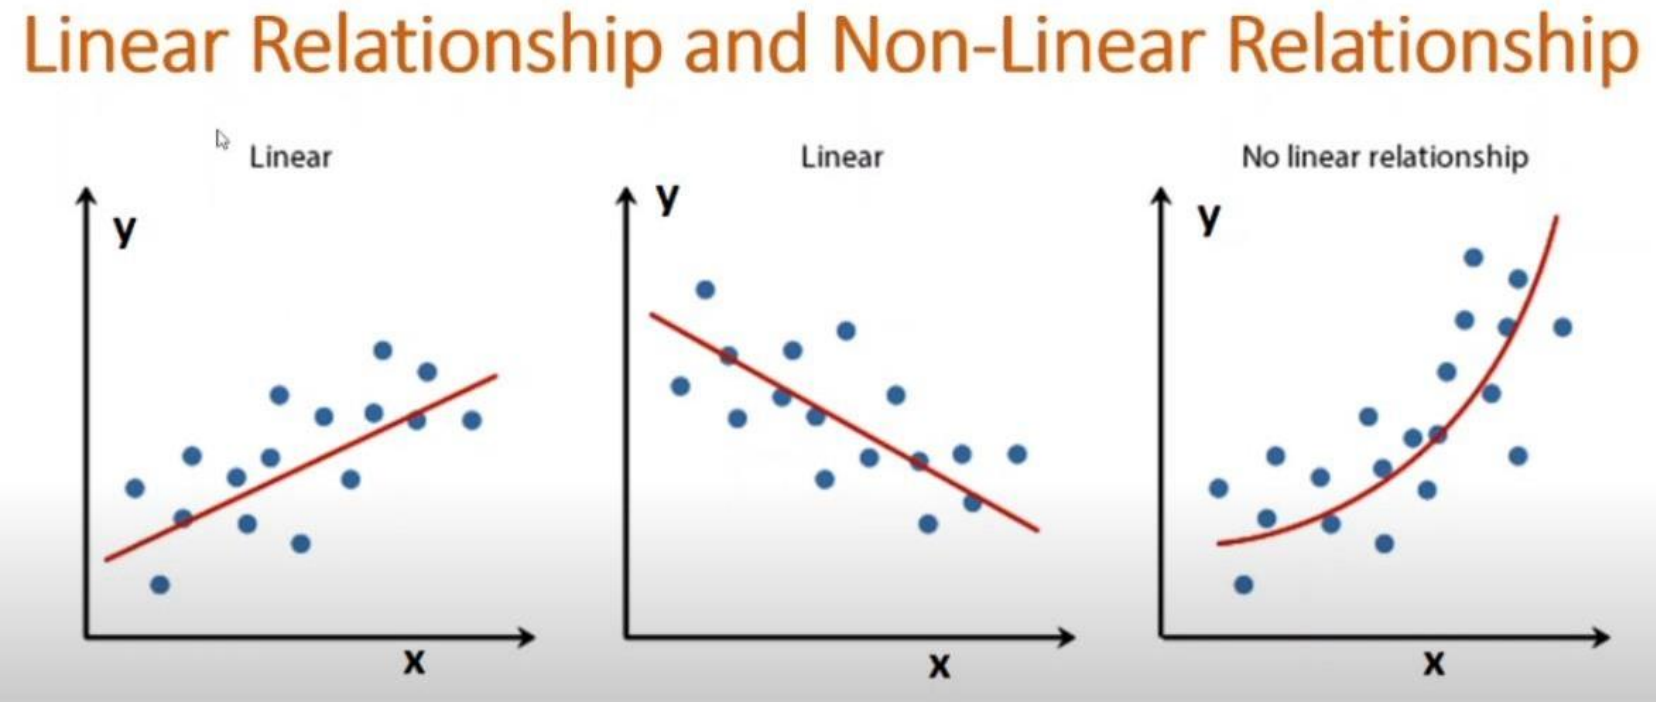
…

Normalization

Normalization = Scaling

Normalization means to scale a variable to have a values between 0 and 1 . Goal of Normalization is to change the values of numerical columns in the dataset to a common scale, without distorting differences in the ranges of values.

Terminologies……



Terminologies……

…

Train and Test Splitting

- X_train , Y_ train
- X_test , Y_test

Random State and Sample Size

Terminologies……

…

6 Model Creation
7 Model Validation
8 Model Deployment

Conti....

1) BUSINESS UNDERSTANDING AND DATA UNDERSTANDING

- Nature of business
- Requirements
- What we need ?
- Goal (Prediction , Descriptive and Prescriptive)
- Final Deployment (On-premises or Clodu) (Online or Offline Learning)
- UAT
- Timelines/Deadlines
- Read all Documents/SOPS

Conti.....

2) DATA COLLECTION AND INTEGRATION

- Type of Data (structured/unstructured or offline/online)
- Source of Data (on premises or Cloud)
- Size of data
- Format of data
- Data transport
- Data Ingestion/Data Collection from all sources
- Data Integration (BODS ETL)

Conti....

3) DATA PREPROCESSING (cd mouz)

- Unstructured in to Structured Format of data.
- **Cleaning** : (Noise,Special Chars,Lower),
- Removing **Duplicate**,
- Removing **Missing**,
- Removing **Outliers**,
- **Unidecode**,
- Removing **Zeroes** values(imputation,
- **Rounding**,
- **Formatting** and **Repairing**(MCORDF)
- Organize the data : version conrol of data , auditing , maintaining data, Court Reviews conferences.

Conti.....

4) FEATURE ENGINEERING (td soieng)

- Data **Transformation** :Normalization (skewing (z-score)), Logarithm log(x) (heteroscedasticity), 1/x, sqrt(x), exp(x)
- **Discretization** : Binning , Equal frequency discretization, Equal length discretization,
- **Scaling** : Standardization , Min-Max Scaling, Mean Scaling, Max Absolute Scaling, Unit norm-Scaling
- **One hot encoding** , dummy variables , Rare variables .
- **Imbalance dataset** : SMOTE, SMOTEtomek , SMOTEEN
- **Extracting** features from text: Bag of words, Tfidf, n-grams,Word2vec, topic extraction
- create some **new** features by using domain knowledge from domain expertise or by using internet and google.
- Performing Statistical and **Graphical** Data Analysis (EDA) : story telling

Conti....

5) Feature Selection

- Convert many features in to important features
- Correlation, Heat Matrix (covariance)
- Multi colinearity (RIDGE, Combining)
- Backward Elimination
- PCA
- NMF
- ICA and FastICA
- SVD

Sklearn library and scikit library

Conti.....

6) Model Creation

- Basis of EDA , we consider Algorithms.
- Free Lunch Theorem **no model is work well for every problem meaning of Free lunch theorem**
- We consider at least 5 to 6 models.
- **Regression** : Linear, Lasso, SVR, Random Forest Classfier, Adaboost Regressor , XG Boost Regressor
- **Classification**: Logistics, SVC, NB, Random Forest Classifier, Adaboost Classifier , XG Boost Regressor, Light GBM and CatGBM
- **Anomaly detection** : Isolation Forest , logistics and Local outlier Factor.

Conti.....

7) Model Validation and Model Selection

- We will apply cross validation on all models
- Time and effort and resources if need to consider.
- Tradeoff between Bais/variance and True Positive/True Negative.
- Best Model will be selected for further tuning. (confusion matrix in case of Imbalance Dataset)
- Hyper Parameter optimisation is always important (Grid Search and Random Search)
- Automated code should be written that which model out of these 4-5-6 models.

Conti.....

8) Model Deployment

- Will generate the pickle file for ML Models
- Develop Front end API using Flask or Django framework
- On premises or Cloud
- Storing the prediction in the Storage.
- Setting up the logging and monitoring frameworks to generate reports and dashboards based on the client requirements and to do continuous monitoring the output to find out whether the model is preforming well or not.

Conti.....

Continuous Improvement

- Internal Evaluation
- External Evaluation
- UAT done by customer to check how model is responding as per their expectations

Scikit-learn

- Scikit-learn (Sklearn) is the most useful and robust library for machine learning in Python. It provides a selection of efficient tools for machine learning and statistical modeling including classification, regression, clustering and dimensionality reduction via a consistence interface in Python. This library, which is largely written in Python, is built upon NumPy, SciPy and Matplotlib.
-

Features

Rather than focusing on loading, manipulating and summarising data, Scikit-learn library is focused on modeling the data. Some of the most popular groups of models provided by Sklearn are as follows −

- **Supervised Learning algorithms** − Almost all the popular supervised learning algorithms, like Linear Regression, Support Vector Machine (SVM), Decision Tree etc., are the part of scikit-learn.
- **Unsupervised Learning algorithms** −On the other hand, it also has all the popular unsupervised learning algorithms from clustering, factor analysis, PCA (Principal Component Analysis) to unsupervised neural networks.
- **Clustering** −This model is used for grouping unlabeled data.
- **Cross Validation** −It is used to check the accuracy of supervised models on unseen data.

Continue

- **Dimensionality Reduction** − It is used for reducing the number of attributes in data which can be further used for summarisation, visualisation and feature selection.
- **Ensemble methods** −As name suggest, it is used for combining the predictions of multiple supervised models.
- **Feature extraction** − It is used to extract the features from data to define the attributes in image and text data.
- **Feature selection** − It is used to identify useful attributes to create supervised models.

Dataset Loading

- A collection of data is called dataset. It is having the following two components −
- **Features** −The variables of data are called its features. They are also known as predictors, inputs or attributes.
- **Feature matrix** −It is the collection of features, in case there are more than one.
- **Feature Names** −It is the list of all the names of the features.
- **Response** −It is the output variable that basically depends upon the feature variables. They are also known as target, label or output.
- **Response Vector** −It is used to represent response column. Generally, we have just one response column.
- **Target Names** −It represent the possible values taken by a response vector.
- Scikit-learn have few example datasets like **iris** and **digits** for classification and the **Boston house prices** for regression.
